

Internet of Radio Light Measurement Campaign in Building Research Establishment

by John Cosmas

Objectives

- The Internet of Radio Light has successfully conducted performance tests of a hybrid Visible Light Communications (VLC) and 40GHz mmWave 5G compliant system in the **Integer House lab** at the **Building Research Establishment**, during the months of August – October 2020.
- The objective of the trial is to measure the **coverage, latency, location accuracy and EM exposure** performance of the designed **mmWave and VLC system**, provide recommendations for improving the design and produce design guidelines for the optimal deployment of the **5G Remote Radio Light Heads (RRLHs) in buildings**.
- It thereby demonstrates how to solve the problem of **broadband wireless access in buildings** and promote 5G global standard.

Internet of Radio Light Concept

Building Research Establishment Integer House

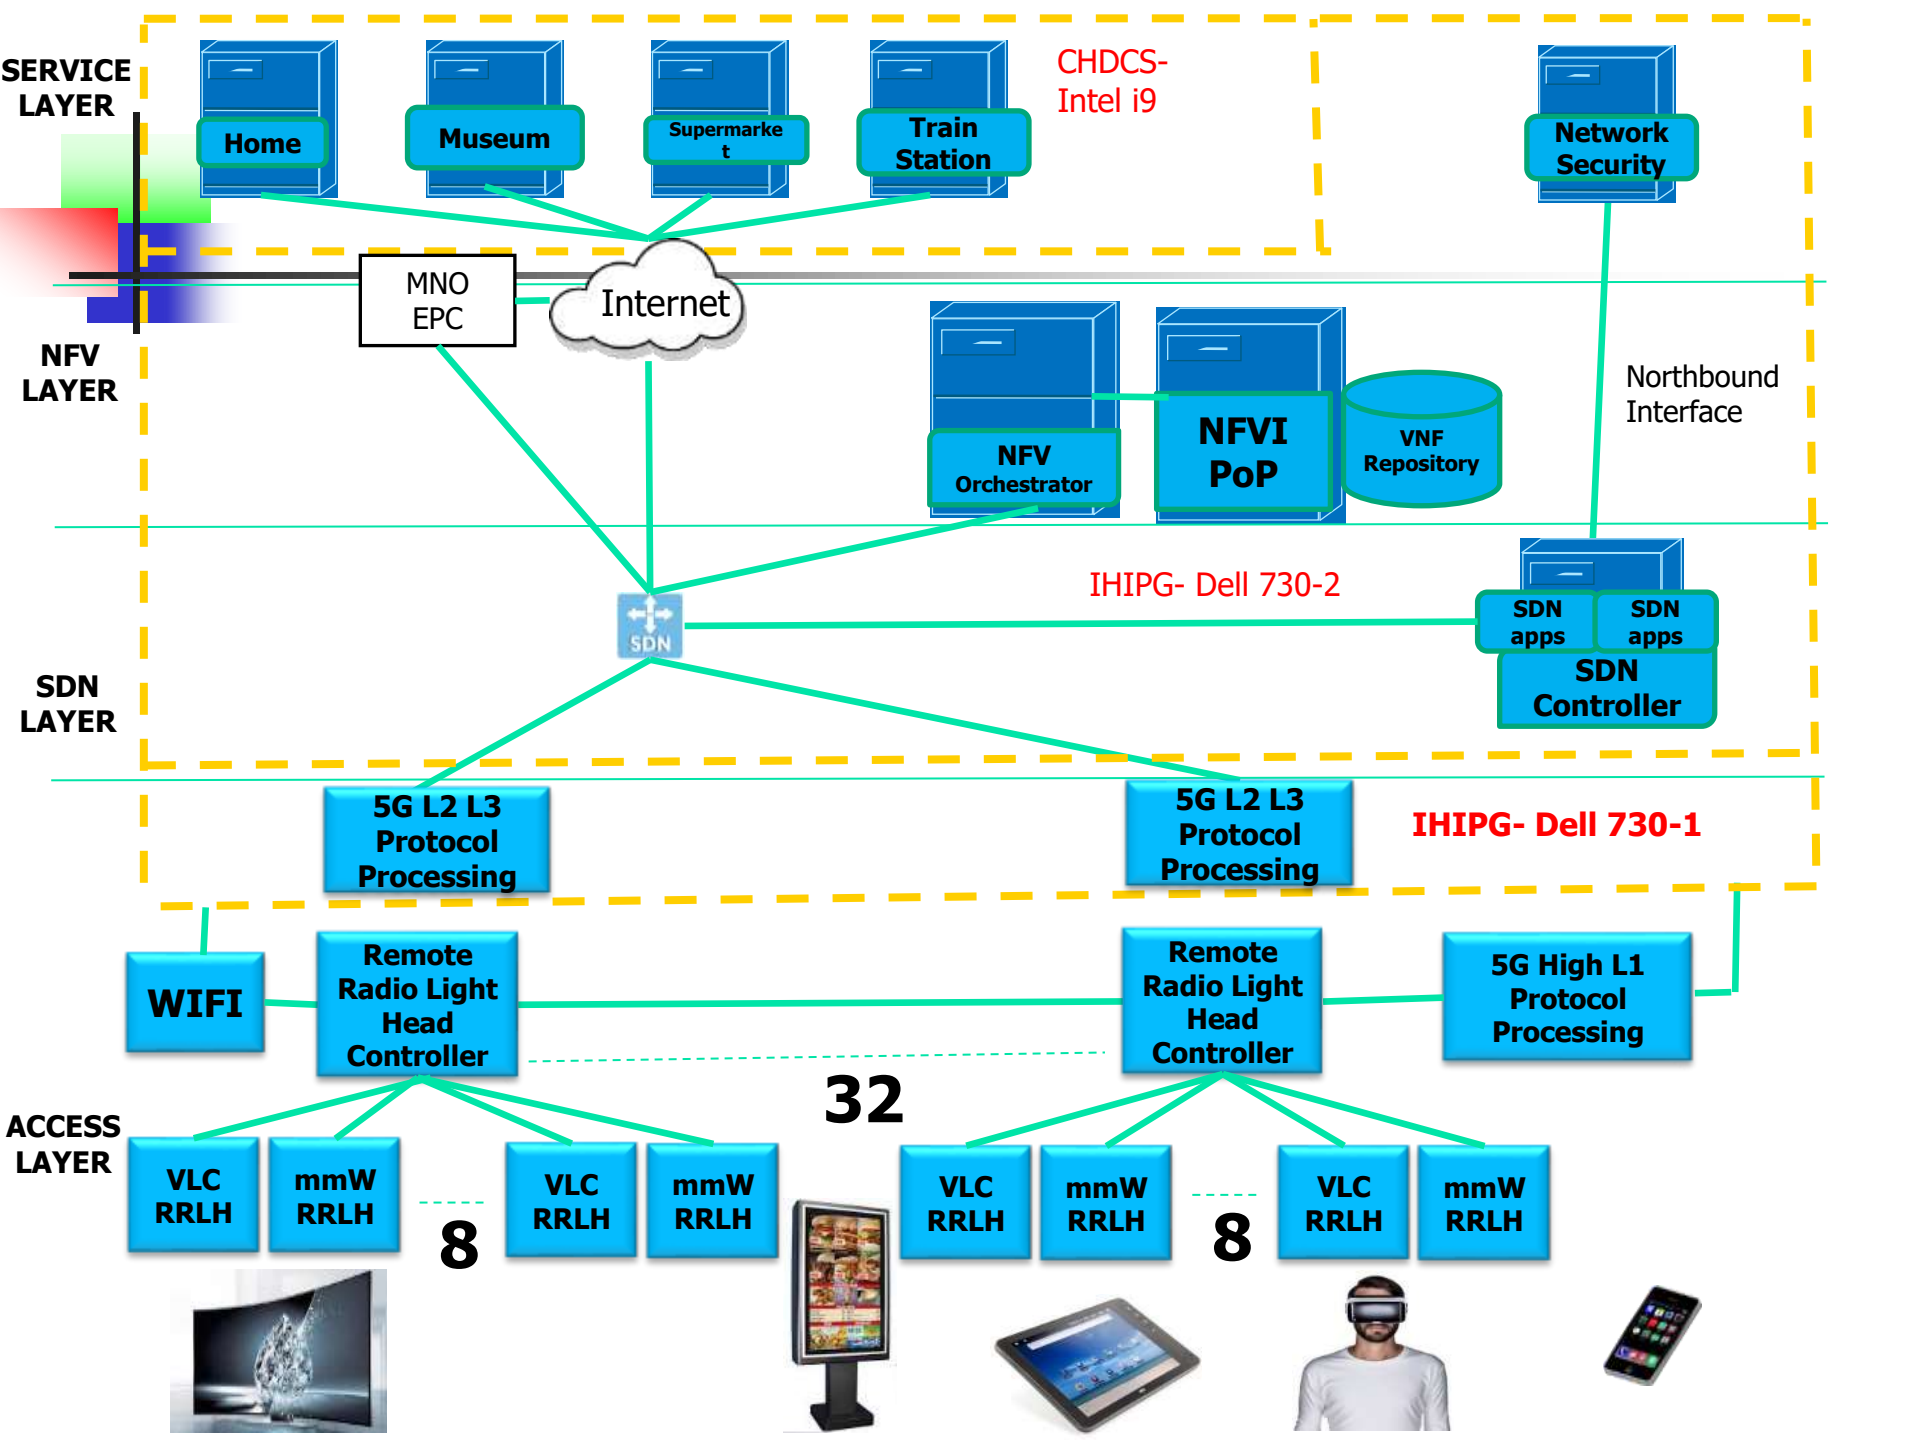

Market Opportunity

- Total number of private households within the EU-28 rose from 195 million in 2005 to 214 million by 2013
- Thus there are around 2.6 billion light access points
- 4.2 million UK home workers in 2014, amounting to 13.9% of the workforce.
- In China, there are 16 national level new areas that have been designated since 2010 consisting of 16,663 Km² of new build urban areas.
- These new areas will be the future homes of 100 million Chinese people or approximately 30 – 40 million households with over half a billion light access points

Building Research Establishment Home

- Internet of Radio-Light Office
- AV Streaming to UHD TV
- 360° AV Streaming to VR Headsets
- < 10cm Location accuracy of UE
- Intra Building and Inter gNB Handover
- Home Video Security Monitoring
- DoS and Rogue Tx Network Security Monitoring

Viavi Solutions Test 5G User Terminal

Error Vector Magnitude (EVM)

- 4-QAM requires an Average EVM < 12%
- 16-QAM requires an Average EVM < 10%
- 64-QAM requires an Average EVM < 8%

Key Performance Indicator mmWave & VLC Throughput, Latency

- 42 Mbps was obtained on the VLC system with 10MHz bandwidth, 4-QAM and SCS=30kHz on the Viavi testbed
- VLC Coverage area 1m x 1m per Light head – making it suitable for personal area networks
- VLC location accuracy 3.5 cm
- 310Mbps was obtained on the mmWave system with 100MHz bandwidth, 64-QAM and SCS=30kHz on the Viavi testbed.
- 70Mbps using 100MHz bandwidth with 4-QAM and SCS=30KHz at mmWave in the laboratory using the Runel testbed
- mmWave coverage area 2m x 6m
- Less 0.5ms latency has been measured at 10 MHz bandwidth at the physical layer between the UE and the DRAN.

Key Performance Indicator Potential mmWave & VLC Throughput

- RRLH Controller and DRAN designs could be enhanced to operate at 400MHz bandwidths with 64-QAM and SCS=30KHz at mmWave to produce **1240Mbps per RRLH Controller** in a final commercial FPGA/ASIC system.
- This **1240Mbps** is scalable since it can be **provided to each of up to 32 RRLH Controllers in rooms in a building** to a **total of 10Gbps** from a 10Gbps Ethernet ring home network.
